Uncoupling Underlayment

## The Most Trusted Tile Underlay

Loxscreen  
FLOORING GROUP

### Uncoupling Underlayment

ProVa-Lay provides all the labor-saving benefits of standard plastic roll uncoupling products and offers the same crack isolation protection. The innovative reinforced mesh panel design of ProVa-Lay enables it to add support to wood substrates which greatly reduces deflection. ProVa-Lay actually replaces the need for a second layer of plywood in many installations and provides greater compression and tensile strength than traditional plastic roll products. It has received the highest Robinson Floor Test rating of "heavy industrial".

For stone installations, ProVa-Lay stiffens a wood substrate alleviating the need for a second layer of plywood. (Minimum substrate thickness for stone installations on joists spaced 19.2" o.c. is 3/4").

### Features & Benefits

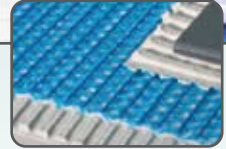

Compared to Standard Roll Uncoupling Products

#### Residential Projects

- Reduces deflection in wood substrates (i.e. 24 o.c. joist spacing)
- Stone installations - increases substrate support
- Large format tile - provides flatter plane and stiffer substrates
- Only 1/8" thick
- Suitable for tiles 2" x 2" and smaller
- Weighs only 1 pound per panel (6.5 sq. ft)
- Latex modified thinset recommended for all tile installations

#### Commercial Projects

- Crack isolation/uncoupling protection
- Superior point load support
- Suitable for tiles under 2" x 2"
- Higher compression strength
- Higher shear strength
- Easier to install
- Ideal for floors exposed to heavy traffic (auto showrooms, airports, retail, nursing homes, hospitality)
